Revolution-Rx™ Testimonials

Judy Ferguson / Cathy White
Rolling Hills Estates, CA
April 2008

Participant in study: Thirteen-year-old QH Paint gelding used for trail riding with chronic diarrhea. Within a few days of starting the supplement, Bo's stools were less watery. After two weeks, his stools were consistently normal, even after ingesting some alfalfa, which exacerbates his diarrhea. Bo's coat is shiny and he appears to have more muscle and more energy. Of the three horses we own, he now looks the most healthy and vibrant. We are continuing him on this supplement and have decided to start the other horses as well. We're very happy and grateful!

Linda Goffman
Murrieta, CA
May 2008

Participant in study: Fifteen-year-old QH brood mare with chronic colic. This mare has had horrible history of gas colic since 2001; vet treated for colic at least 10 times including 2 surgeries with 3 hospitalizations; and most problems occurring during last trimester and soon after foaling. The mare only had one colic episode within the 30 days we had her on the special feed. She is one of the best mares I have ever had and she will be on it the rest of her life.

I do think this product has a lot of uses in any feeding program. I am weaning horses right now and have these colts on it. I also have HYPP N/H horses and like the idea that I have them on it too.

Lori Irvin
Nuevo, CA
April 2008

Participant in study: Twenty-six year old Appendix QH retired gelding with chronic diarrhea and weight loss. I have seen results by the end of the second week of full dosing. Thank you! Thank you! Previously, he had diarrhea so bad he need daily cleaning, and I know he was not getting the nutritional value required from his feed. I did have difficulty getting him to eat it alone and I still have to wet it and mix it with his grain. I told my vet about the product, and referred it to friends who have horses in their twenties.

Marina McNutt
Acton, CA
April 2008

Participant in study: Today is about half way through the study; horses are fed the full amount of supplement, and loving it! The change that we have noticed so far is that both of the horses are now just about sound. There is about 75% improvement in their soundness. This is hard to believe, but it's true. Confetti (our retired polo mare) was severely lame since her injury in the spring of 2006...now it seems like she has a new lease on life...and she acts like it too!!! Buddy, the old arthritic quarter horse that nobody could ride any more is sound as well!!! Go figure! I would like to continue with it after the 30 days are over.

Kristin Loft
Camarillo, CA
May 2008

Participant in study: Thirty-year-old registered TB gelding (retired hunter/jumper) with non-infectious chronic diarrhea and weight loss. In the past, we have experimented with various types of feed and supplements, including recommendations made by an equine vet, and his diarrhea remained chronic. After starting the study, the diarrhea subsided. Now that the horse no longer receives Revolution-Rx™, the diarrhea has returned. I will purchase more of the product since his symptoms did improve.

Richard Jimmink
Palmdale, CA
May 2008

Participant in study: Twenty-year-old Quarter/Mustang gelding used for trail riding with weight loss. Horse was up to recommended dose in four days and willingly ate the ration with no difficulties throughout the study period. Despite the ration being approximately half of the prior ration, the horse kept his weight stable, appeared more energetic, and improved overall muscularity. Feed ration went from 6lbs of Purina Senior to 3lbs of Revolution-Rx™ with no weight loss.

Robert Crawford
Apple Valley, CA
May 2008

Participant in study: Twenty-two year old Morgan gelding used for trail riding with weight loss. The Morgan increased his weight approximately 50-75 lbs during the test period. He ate the Revolution-Rx™ pellets without any problems from day one. His stool was smaller as you indicated it would be. I think it's going to take 3-4 months for his weight to come back. He appeared to feel better, more lively, during the test month. I attribute it to Revolution-Rx™. I told my feed store that this product is worth stocking.

Hilo Nick
Santa Barbara, CA
May 2008

Participant in study: Six-year-old TB gelding used for dressage with chronic diarrhea. In the beginning, he didn't want to eat it, got use to the new supplement after 10 days. The diarrhea is now under control and horse is fed 3lbs per day.

Nancy Risen
Murrieta, CA
May 2008

Participant in study: Seventeen-year-old Arabian gelding used for show and pleasure with severe colic with distended stomach. Initially needed to mix new product with current feed. The product seems to be helping and notice some difference in stomach. Horse feels terrific on the product. Thank you for the opportunity to try the product.

Jean Jenkins
Thousand Oaks, CA
May 2008

Participant in study: Twenty-five year old Appaloosa gelding used for pleasure and trail riding with severe diarrhea and weight loss. My horse has had serious diarrhea and some weight loss since April 2007. At one point, treated him for blood worms (evidenced by black butt tracks) with Panacur but treatment failed to correct the problem. Nothing has helped except Revolution-Rx™. We noticed a marked improvement after the second week of feeding 2lbs daily and are currently feeding 3lbs daily. The butt tracks and diarrhea have decreased dramatically and I feel he should continue with Revolution-Rx™ as part of his feed program for the foreseeable future.

Heather Jones
Newbury Park, CA
May 2008

Participant in study: Five-year-old TB gelding used as hunter/jumper with numerous ulcers and weight loss. Needed to mix senior feed with Revolution-Rx™ initially for acceptance. Gained over 100lbs in 2.5 months. Also used ulcerguard 4 weeks while on Revolution-Rx™. Please send product information to my vet.

Candace Matyuch
Yorba Linda, CA
May 2008

Participant in study: Twenty+-year-old rescued Arabian gelding used for pleasure and trail riding with chronic diarrhea. I followed Biovance's feeding instructions by mixing supplement with senior feed and he was up to full feeding level within 3 days. Diarrhea stopped within 2 weeks. Horse started to gain weight so vet suggested reducing feed intake, so reduced daily senior feed and hay amounts. Horse is doing great and is maintaining current weight. Stopped using all supplements, except Revolution-Rx™. I own 2 horses (1 on Revolution-Rx™ and 1 not) and both were moved to new barns while on this study. The horse on Revolution-Rx™ made the move without any health problems, the other horse took over a month to adjust to new

surroundings. I attribute this to Revolution-Rx™. I will continue to use Revolution-Rx™ on my rescued Arabian and will start the mare that I use for barrel racing on it soon.

Angie Hagan
Ramona, CA
May 2008

Participant in study: Twenty-six year old Qtr/TB mare used for pleasure with ulcer symptoms and going off feed every other month, and Cushing's symptoms including long hair and frequent urination. This mare no longer suffers from upset stomachs, had a 30-40% reduction in urine output, and is more energetic.

Porter Warren
Llano, CA
May 2008

Participant in study: Twenty-seven year old retired racing QH gelding used for riding lessons with intermittent diarrhea throughout last 10 years and negative evaluations for sand colic and ulcers. Horse had diarrhea initial 3 days of starting study and has had no episodes since; and maintained weight. I have recommended the product to others with older horses.

Ted Diggins
Woodland Hills, CA
May 2008

Participant in study: Two-year-old Paint gelding to be used for pleasure and show with diarrhea. Horse was foaled in ND, pasture raised, weaned early and sent to CA. I tried to regulate it with different kinds of hay which didn't work. Diarrhea stopped once he was on Revolution-Rx™ and he is growing and coat condition has improved. I'm a trainer and will recommend Revolution-Rx™ to all my clients.

Crystal Hancock
Phelan, CA
May 2008

Participant in study: Four-year-old QH rescued colt; severely under weight with backbone showing. Amazing! We have tried everything to put weight on this horse and nothing has worked. We are so happy with the results – one more month and you would never know he ever had a problem. Where can we get more!!!

Dara Rip
Woodside, CA
May 2008

Participant in study: One-year-old Hanoverian filly with chronic, intermittent diarrhea; filly's manure cultured for disease (no disease), tested for ulcers (no ulcers), teeth checked (healthy), wormed regularly, and oat hay worsened condition. Diarrhea subsided after 9 days, but it returned as soon as study ended. It took adding small amount of molasses to get filly to eat feed initially. I would use feed based on initial results.

Eric Cohen
Woodland Hills, CA
June 2008

Participant in study: Twenty-two year old neglected Arabian mare with missing teeth, poor remaining teeth, unable to eat/digest hay, and horrible body weight. Since obtaining her, I have hand fed timothy pellet, rice bran, and senior, and felt that she was still losing weight. I chose to take 2 weeks to raise the feeding quantity of Revolution-Rx™ up to the suggested 3 lbs per day. During this 2-week period, I noticed her hair coat becoming very soft to the touch and that it had lost that sticky feeling. After 4 weeks, the coat became very shiny and really smoothed out and her rear flanks started to fill in behind her stomach. It's been a pleasure watching her fill out and start to move in the right direction. I have also added corn oil to her diet and feed everything dry. She has not choked or anything. We are on the right path. I will continue to feed Revolution-Rx™ and have ordered another bag from our tack store.

Cabazon, CA
December 2008

Participant in Study: Twenty-nine year old Mule gelding with no teeth and weight loss. One noticeable result from the study is that this mule's coat is a normal wooly winter coat, not long and silky. He has put on weight and has significant increased energy, with more of a bounce to his step. I intend to start another mule with weight loss issues on Revolution-Rx™ as well.

Denise Wisham
East Lake Weir, FL
June 2008

Participant in study: Fifteen-year-old Appaloosa gelding with chronic colic (last one severe) and weight loss. I began the study 4/10 and my horse is doing great. He regained his weight and his coat looks great. Best of all, we have not had another bout of colic! Thanks so much -- he will be on Revolution-Rx™ the rest of his life.

Tasha Byerly
Brooksville, FL
June 2008

Participant in study: Five-year-old QH mare in training for Western Pleasure with being a very bad stall walker, trouble maintaining weight and was prone to mild bouts of weekly colic. She quit stall walking just 7 days after starting on Revolution-Rx™. There were no colic issues after 14 days. She has gained weight, not looking ruby and gaunt, and is more relaxed and calm, not more stall walking, and no more colic! Thank you!

Kari Kelsall
Reddick, FL
June 2008

Participant in study: Sixteen-year-old retired reining QH gelding that came home at the end of a lease from Texas thin, dehydrated and depressed. Revolution-Rx™ really turned this horse around quickly. Started drinking and eating much better, gained weight quickly, and was able to go back to work in 45 days. I am extremely satisfied with the product and will purchase it. I have already referred product to one of my horse buddies.

Marvin Saurbier
Citra, FL
July 2008

Participant in study: Four-year-old TB mare used for racing that came back from track thin and not eating or performing well. Once on study, filly quickly filled out. Put her back in training, breezed well twice. Sent her back to the track a little fatter and happier, and took enough Revolution-Rx™ for 30 days.

Terry Byatt
Newberry, FL
August 2008

Participant in study: I had 2 horses on this study: one a ten-year-old half Arabian gelding used for trail riding with weight maintenance problems; and one a sixteen-year-old TB gelding used for lawn mowing with colic episodes and uneven fat distribution due to sweet feed. The Arabian maintained his weight and his manure was drier. It took him longer to accept the new feed. The TB gained some weight in his hindquarters and didn't seem to be as stressed by the FL heat and humidity when on the study. I would like to keep both of them on the product this fall when the pasture dries up.

Carri-Anne Powell
Trenton, FL
August 2008

Participant in study: Thirty-four year old half TW mare used for light riding suffering from drastic weight loss (800lbs now vs. 1200lbs in 2007). During the study, she gained about 100lbs according to the tape measure, but not sure as to actual weight gain. She acted a little younger and would kick up her heels in the morning. I did recommend Revolution-Rx™ to a friend that has an 18-year-old TB that has not gained his weight back since surgery.

Gwen Ajar
Anthony, FL
August 2008

Participant in study: Nineteen-year-old QH mare described as a cribber, possible ulcers and a hard keeper. Mare gained weight after 3 weeks and maintained weight on less feed, saw less manure, and skin/coat improved.

Charles Wright
Argyle, TX
July 2008

Participant in study: Twenty-four year old QH gelding used for pleasure/show that could not maintain weight. The horse did get up to the recommended daily dose by the end of the study, but was difficult to get him to eat it initially. Horse did maintain weight and coat quality improved.

Lisa Ferguson
Sanger, TX
Sept 2008

Participant in study: Twenty-four year old Jackstock who had poor condition, poor coat, and underweight. I saw a definite improvement in condition because of Revolution-Rx™. He gained weight (almost up to ideal), improved hair coat, and seemed there was a reduction in his arthritic symptoms.

Robert Frank
Grapevine, TX
Sept 2008

Participant in study: Twenty-three year old QH gelding who had chronic diarrhea that was not stopped by diet changes, ProBios and tons of medications. Within 10 days of just a Revolution-Rx™ and hay diet the diarrhea stopped, stools are getting better on a daily and gradual basis. He also is regaining weight and has more energy and spirit than I have seen in him in YEARS! You literally saved my horse. He now only eats Biovance's maintenance diet, Revolution, and hay. I will be moving my second horse, a 10 year old that is not compromised, onto Revolution on a gradual basis.

Whitney Mims
Krum, TX
Sept 2008

Participant in study: Seven year old TB gelding subject to chronic weight loss. Horse gained wait and held his weight, is now weighing 1400 lbs, previously weight 1250 lbs. He is much happier off all fat supplements, which makes feeding time much easier. I think that this would be an excellent feed for vets to push. I have told other people about product. Think it is excellent.

Stephanie Svatek
Dale, TX
December 2008

Participant in study: Nineteen year old Trakehner mare who had just finished weaning a colt and was VERY underweight. Within 3 days, I saw significant change in attitude and energy. This mare, who acted her age when I bought her, started running and kicking up her heels, just for the sake of doing it! At the end of 1 week, I noticed slight weight gain, and at the end of 2, I noticed significant weight gain. "I'm a Revolution-Rx™ believer!"

Magnolia, TX
December 2008

Participant in study: Eighteen year old rescued QH mare suffering from severe weight loss and stress from hurricane and tornado. Within 1 week, horse's appetite improved and body condition began to improve. By 21 days, coat was shiny and muscle mass showed marked improvement, as well as top line improvement. Horse gained about 75lbs during the 1-month study. Horse has increased energy – she trots and canters again. "This product is amazing!"

Barbara Brasher
Grandview, TX
December 2008

Participant in study: Twenty-five year old QH gelding suffering from weight loss. Jazz did put on weight and had more energy and pep in him than my three year old. I started all my compromised mares on Revolution-Rx as well. I have passed along product information to friends and family, including my farrier.

Bess Hadley
Baytown, TX
December 2008

Participant in Study: Twenty-five year old AR gelding weighing 800 lbs, with chronic colic, ulcers, and weight loss. Within 2 weeks, I noticed marked weight gain and an improvement in hair coat. By end of the study, he had gained a good 200 lbs and showed improved energy levels.

Kelly Hester
Bedias, TX
December 2008

Participant in study: Eight year old QH mare used for barrel racing that is a hard keeper, sensitive to feeds, nervous, anxious, poor performance, and has episodes of "tying up". Within the first week, her coat started to improve, her general attitude started to improve. She became easier to catch, was better to ride, and in the second week, I had to let the girth out a notch because she had gained weight. People asked if she was the same horse.

Theresa Lisenby
Scurry, TX
December 2008

Participant in study: Twenty+ year old QH gelding used at a therapy riding center suffering from severe weight loss, chronic diarrhea, and chronic colic. Horse has gained 100 lbs, stopped losing hair, the diarrhea stopped, and is stronger and bright-eyed. I used this product on a total of 4 horses and all have put on weight and improved health.

Crockett, TX
January 2009

Participant in study: Fifteen year old TB mare not able to regain weight post foaling and weaning. Revolution-Rx™ put the weight on her quickly and she has maintained it fairly well. I have been quite pleased with the results.

Betsy Huber
Sparta, MI
August 2008

Participant in study: Six-year-old stalled Arabian gelding used for show experienced weight loss due to pacing, which was attributed to stress of show environment, transportation and conditioning regimen, and suspected ulcers causing colic-like episodes. It took about a week for the horse to eat the feed, as he did not like the smell of it. Horse had plenty of energy on this product to keep up his conditioning. We did not experience any colic-like episodes on this product. Horse did seem more content with this feed. A 30-hour trailer ride went well and horse started right on this product after 2 days off for transportation.

Laura Colasanti
Otsego, MI
August 2008

Participant in study: Twenty-seven year old QH/Mustang gelding used for trail rides. Due to previous history of abuse, he has almost no teeth and would drop lots of weight in both extended hot summers and cold winters. I fed him 2lbs per day during the study period. His coat is like silk and very shiny; topline came up and filled in; weight stayed even in extended heat and the extra weight didn't bother his asthma and breathing; stool stayed consistent; shed out to a copper color rather than his usual chocolate brown; has so much more energy; and, his eyes are super bright. I have had many people mistake him as a new horse on our farm and amazed with his results and would like to try it and know the cost. I would like to know where I can buy this near my home to continue him on this product.

Amy Cubel
Bowling Green, IN
August 2008

Participant in study: Twenty-eight year old TB gelding used for trail riding with weight maintenance problems. He did gain some weight but feel that 30 days on product was not sufficient for him; several months on product, I know I would have seen a huge difference in weight gain. The biggest difference I noticed in him was the way he felt. He had much more energy than previously. I took him trail riding and he actually wanted to lead the pack when he usually lags way behind. Revolution-Rx™ did not make him antsy, just more energy. He also had small manure and it was more solid than normal.

Tracy Hutchins
Kendallville, IN
Sept 2008

Participant in study: Five year old TB gelding just off of racetrack, thin, nervous & colicky. He had coliced 3 times between Dec & March, typically after a move to a new facility or a trailer ride. "Stormy" started Revolution-Rx™ 1 week before leaving our farm for the trainers. He did not colic and indeed gained weight even though he went directly into daily work from being out to pasture. He has not coliced since. His coat improved dramatically. The horse moved to another farm after 30 days training. No colic incidents since.

Lisa Pryor
New Castle, IN
Sept 2008

Participant in study: Late twenty year old QH gelding suffering from extreme weight loss. My horse gained at least 100 lbs while on the 30-day study with increased activity and a better coat condition. I have referred this product to at least 5 other people.

Janet Egolf
Rochester, IN
July 2008

Participant in study: Thirty year old QH gelding used as a pasture horse becoming thinner as he ages and more lethargic. While on the product Revolution-Rx™ I noticed an improvement in actions, he was spunkier. He did have a slight weight gain. I definitely saw a difference.

Christine Emrick
Allen, MI
August 2008

Participant in study: Twenty year old AQH mare used for shows who had difficulty maintaining and gaining weight; fussy eater that wouldn't eat her grain at all if any supplement added to it. With Revolution-Rx™, she did not need an adjustment period and she consumed the full ration from day one. With the current rate of feed, she put on weight and consumed more water. Topline filled in and increased muscling was noticed. I would purchase this product to feed to all my horses. I believe Revolution-Rx™ is very beneficial.

Teri Cox
Frankenmuth, MI
August 2008

Participant in study: Twenty-three year old half AR gelding who began to lose weight in Nov07 due to death of his lifelong best buddy, he was depressed, listless, and not interested in food. Did bloodworm and fecal count in 12/07 (nothing wrong), had teeth floated in 1/08, as well as chiropractic work every eight weeks since 11/07 with little improvement. He gained 25lbs while on Revolution-Rx™; his ribs have more cover and a better "life" to his coat. Attitude somewhat better but not what it needs to be. He needs to find another best friend to hang out with.

Alison Nichols
Marion, IN
Sept 2008

Participant in study: Twenty-five year old QH gelding who had lost weight over the winter and has not gained it back. He seemed to really like Revolution-Rx™. He has gained and kept his weight on.

Dana Saxton
Freeland, MI
Sept 2008

Participant in study: Seventeen year old Miniature mare used for breeding that couldn't keep weight on for the last 5-6 years. She put on weight and her hair coat is smoother and shinier. She seems to have more energy. She has worked her way back up to boss mare, which she had not been for several years. She also has more appetite and eats well, while before she would nibble and wander off.

Debbie Ulrich
Durand, MI
October 2008

Participant in study: Thirty year old Morgan/Welch cross gelding with weight loss issues. Horse's appetite increased and picked up weight, and became active again. His coat also became shiny again. I recommend this product, big time.

Patricia Heiden
Rochester, IN
August 2008

Participant in study: Twenty-one year old QAR gelding used for 4H and trail rides. He had coliced two times with major surgery in Dec 2007 and has not been able to gain back weight. While on Revolution-Rx™, he had no problems with colic and gained weight as evidenced by hindquarters and rib area. He did prefer it mixed with sweet feed.

Mark O. Burnette
Williams, IN
September 2008

Participant in study: Three year old Mustang gelding used for national competition (Extreme Mustang Challenge) that could not maintain weight due to inconsistent appetite and had loose stools. During the Revolution-Rx study, he had more consistent appetite and weight gain for endurance training. Also, coat has a nice shine (he glows in the dark). I'm keeping him on Revolution-Rx through competition.

Traci Topalis
Millis, MA
October 2008

Participant in study: Twenty-three year old TB gelding suffering from numerous age-related issues. Horse had immediate change in bowels. This is the first time in 3 years he's had normal manure.

Leslie Karkos
Foster, RI
October 2008

Participant in study: Ten year old Paint gelding with severe muscle injury requiring long rest, losing fat, muscle, stamina, and depression caused by loss of pecking order. Horse is much brighter, has more energy, and plays more. He looks great, his top line is smoother, his hindquarters are rounder, he is no longer ribby, and his neck has more muscle. "He let out a fell good buck in play for the first time in a long time."

Susan Lightfoot
Swanzey, NH
October 2008

Participant in study: Twelve & thirteen year old TB geldings, both with weight loss issues, one a hard keeper and the other with ulcer problems. Both horses gained a lot of weight and were less irritable after eating. The horse with ulcers showed a very healthy coat in 2 weeks and started gaining by the 3rd week. The other horse showed vast improvement in his weight within 3 weeks. We have tried to put weight on this horse for 3 years and nothing has worked. This product absolutely worked on both horses!!!

Kendra Cooper
Peculiar, MO
October 2008

Participant in study: Thirty year old AP gelding with periodic bouts of diarrhea and weight loss issues, with lack of energy and lethargic behavior. The horse had no issues of diarrhea – firm and consistent stools with a noticeable increase in his energy level. He was alert and attentive and I did not notice bouts of lethargic behavior. Weight gain and maintenance was good.
